

"Annotations are brief, yet informative and logical"

Example #1 - Lab T2: Specific Heat of a Metal

= First, analyze the surroundings for heat gain

$$\begin{aligned}Q_{\text{water}} &= m_{\text{water}} \cdot c_{\text{water}} \cdot \Delta T_{\text{water}} \\&= (100.0\text{g}) \left(4.184 \frac{\text{J}}{\text{g} \cdot ^\circ\text{C}}\right) (26.0 - 22.0) \\&= 1673.6\text{J} = 1.7 \times 10^3\text{J}\end{aligned}$$

= Now assume heat gained by H_2O = heat lost by metal. Thus $Q_{\text{metal}} = 1673.6\text{J}$

= Calculate heat capacity of metal:

$$\begin{aligned}Q_{\text{metal}} &= m_{\text{metal}} \cdot c_{\text{metal}} \cdot \Delta T_{\text{metal}} \\c_{\text{metal}} &= \frac{Q_{\text{metal}}}{m_{\text{metal}} \cdot \Delta T_{\text{metal}}} = \frac{1673.6\text{J}}{(63.546\text{g}) (101.0 - 26.0^\circ\text{C})}\end{aligned}$$

$$c_{\text{metal}} = 0.35\text{J/g} \cdot ^\circ\text{C}$$

= Theoretical value = 0.385 J/g °C

= % error calc'n:

$$\% \text{ error} = \frac{|0.385 - 0.35|}{0.385} \times 100 = \underline{\underline{9.0\%}}$$

Example #2 - Lab T4: Heat of Solution

= Begin with H_2O (the surroundings)

$$\begin{aligned} Q_{\text{water}} &= m_{\text{water}} \cdot C_{\text{water}} \cdot \Delta T_{\text{water}} \\ &= 4.184 \frac{\text{J}}{\text{g}^\circ\text{C}} \cdot 100.0\text{g} \cdot (40.0 - 16.6^\circ\text{C}) \\ &= 9790.56 \text{ J} = 9790 \text{ J} \end{aligned}$$

= Assume heat loss by water was gained by system (NH_4NO_3)

The 40.00g NH_4NO_3 gained 9790.56J of heat

= Find heat of solution of NH_4NO_3 in kJ/mol

$$\Delta H = \frac{9790.56 \text{ J}}{40.00 \text{ g}} * \frac{1 \text{ kJ}}{10^3 \text{ J}} * \frac{80.06 \text{ g}}{1 \text{ mol}}$$

$$\Delta H = 19.5958 \frac{\text{kJ}}{\text{mol}} = \boxed{19.6 \text{ kJ/mol}}$$

= Theoretical value = 25.69 kJ/mol

= % error calculation

$$\% \text{ error} = \frac{|19.6 - 25.69|}{25.69} * 100 = \boxed{23.7\%}$$
